

WOOD IN ARCHITECTURE

TRENDS 2022

GLOBAL MEGATREND

# No. 1. 1

## SUSTAINABILITY & BUILDING WITH WOOD

Environmental considerations aren't optional anymore – it is a must-have. Especially in construction industry that accounts for 38% of CO2 emissions. Real wood has many benefits – it is **sustainable, renewable, and has low carbon footprint**. In practice, timber is strong, durable, and has multiple use cases as it can be modified to have the exact look and feel that is needed. Many forward-thinking cities have taken the initiative and started promoting timber as the **preferred** building material.

## ON THE AGENDA

• 75%

Majority of architects, engineers, contractors and owners/operators put sustainability high up on their agenda.

## IMPACT OF LIFESPAN

• 44%

Prolonging a building's lifespan from the rough average of 50 years to 120 years will reduce its environmental impact by 44%.

## CLIMATE DECLARATIONS

• 2022

Sweden is one of the first nations to mandate climate declarations. As of 2022, contractors must submit climate declarations for all new builds with data including raw materials, on-site construction and manufacturing of building products.

## HIGH STANDARDS

• 2030

Japan and Canada are two of the forerunners developing new policies to achieve net-zero and net-zero-ready standards for buildings by 2030.

BIG CITY LIFE

# Urban dwellings

Choosing wood as a main building material for urban living spaces can have substantial impact on the environment and peoples' well-being.

OFF THE GRID

# Tiny homes

The tiny house movement advocates for downsizing living spaces, simplifying and essentially "living with less." Affordability, efficiency, eco-friendliness and minimalism are the most attractive factors that the lifestyle has to offer.

GLOBAL MEGATREND

## BIOPHILIC DESIGN – CONNECTING WITH NATURE

A trend is taking root in the worlds of architecture and interior design based on using **natural materials** and **living plants** to better connect people with the outdoors. Many studies have proven that integrating biophilic design principles in places that we live and work can **improve our well-being**, especially as we spend more time inside and connected in the virtual world rather than the natural world. Biophilic design comes in many forms – from using natural materials like **wood** and creating lush **indoor gardens** to developing expansive **transitional spaces** that seamlessly connect the indoors and outdoors.

## PLAYFULNESS WITH MIXING AND MATCHING

Just because **natural wood** has a traditional look, it doesn't necessarily have to be conventional and uninspiring. Don't be afraid to break the mold and complement the classical appearance of wooden sidings with a little twist – sometimes it's good to think outside the box and create something surprising. It's time to stimulate your creativity – **mix and match** for eye-catching results, giving depth to your facade by creating a beautiful **play of shadows** in changing light conditions. Profiles can be installed vertically with screws or nails, and depending on the profiles you choose, you can select either **hidden or visible fixings**.

### PAINT IT BLACK

Sleek, bold, and modern. Black timber cladding ticks many boxes that architects and homeowners are looking for. It gives buildings a contemporary, minimalist look that allows **architecturally** designed houses to stand out, no matter if the building is situated in busy urban environment or surrounded with vibrant greenery. Black cladding is a **striking complement** to other materials like concrete and can create a sense of depth, texture and dynamic external facades. Modern technology, including thermal modification, makes coated timber also a **durable** and **low-maintenance** choice.

VIVID BY THERMORY

# As black as it gets

Traditional material, contemporary solutions. The thermally modified spruce cladding boards are coated with weatherproof paint, giving it a maintenance interval of 10 to 15 years depending on the coating thickness you choose.

IGNITE BY THERMORY

# Details that matter

With cladding that has a charred wood appearance, your home will be anything but ordinary. Ignite cladding provides the same appealing look, with durability all the way through to the core.

LET NATURE TAKE ITS COURSE

## AGING WITH DIGNITY

As a natural material, the colour of wood alters over time - and there is no exception with our enhanced timber products, which gradually take on an attractive gray patina as they age. Over time, the wood will begin to take on a gray color – this can vary from a bold silver or platinum gray to a lighter rustic tone depending on the wood and the conditions it has been exposed to over time. Not only is this beautiful, but it is also practical as it requires **very little maintenance**. Silver, just like George Clooney, never gets old nor goes out of style.

MAKE A STATEMENT

## ACCENT WALLS

Give your walls the attention they deserve! With a little imagination, the walls can become highlights of the entire house! Slatted wood can be used as interior wall paneling in modern and contemporary homes and offices. This is a good idea for those who look for **dimension** and **texture**.

Accent walls have the power to create interest for the eye without overtaking the whole room. If you're looking to add a **sleek finish** to your modern design, then this just might be the winner. After all, your room has only 4 walls – make at least one of them count!

## EARTHY & PASTEL COLORS

Color does much more than affecting the way you think and feel. It gives any interior a considerable character. You can combine complementary or similar colors - choose two, three or even more harmonious hues. Even with earthy colors you can choose between more muted palette or lively tones. Reflect your personality onto the walls and let your house be your canvas! Why not try combining **painted walls** and **natural color wood** cladding - an excellent way of creating a striking pop of textural contrast.

TAKE A MOMENT TO RELAX

## WELLNESS AT HOME

Although inspired by the pandemic, health and wellness trends reflect long-term changes in society. It could be from virtual yoga sessions with others, running outdoors alone, saving for a rainy day, or building your very own **wellness sanctuary** at home, complete with sauna. Taking care of your physical and spiritual well-being has become a priority for many. **Saunas** have a strong tradition going back many centuries (or perhaps even longer) and it has many benefits for mental and physical well-being which explains its **increasing popularity** all over the world.

REAL WOOD CLADDING

# Why thermally modified wood?

## BUILDING SUSTAINABLY

Wood is an absolute **gem** in the world of building materials. It's reliable for even the most demanding designs. And we've taken it a step further by naturally modifying the wood's properties to create an extremely **durable** and **climate-resistant** material with unrivaled **performance** and **sustainability** compared with the usual alternatives such as plastic composites, chemically treated timber and tropical hardwoods. Irregular shapes call for reliable materials that can offer much-needed stability. Create breathtaking designs that **leave a lasting impact**.

## DURABILITY

Worried about the lifetime of your cladding and the maintenance of natural wood? Thermally modified timber is not susceptible to fungus, mold or bacterial organisms, which is why exteriors made from thermally modified wood last significantly longer than other wood exteriors. Therefore, there is no need to replace a structure made with thermally modified products as often as one made with regular wood. In comparison to non-modified timber, it needs a lot **less maintenance**, which means more free time for you. Thermal modification has a distinct **exotic look**. Want the durability, but don't want to compromise on aesthetics? We feel you!
